

## Quick Start Guide: Cable Connection Kit

This document guides the user on how to install Kobelt's cable connection kits. The image below gives a general overview of the installation and parts (parts shown in colour are what would typically be included in a kit). Detailed step-by-step instructions can be found on the next page. If your kit does not include a clevis and clevis pin, then only step 6 is relevant to your kit.

- 1. Thread the clevis onto the cable and secure it by tightening the jam nut
  2. Apply a small amount of grease to the pin and place it in the clevis hole
  3. Loosen the two flat head screws until there is enough space between the retainer plate and the pivot plate for the clevis pin (the screws do not need to be completely unthreaded)
  4. With the pin in the clevis, fit it to the holes in the retainer and pivot plates that provide the desired stroke
  - 5. Tighten the two flat head screws that were loosened earlier
